Example Artifact 1: Purrfect Pursuit

Overview

There is a troublesome mouse in your home! Now, it's up to your two brave and adventurous cats to go find and defeat it. This is a two player game, so grab a friend and discuss which cat you want to play. Explore through the house, avoid threats such as cat toys, mousetraps, and furniture. Once you reach the end and catch the mouse, you win!

The two cats will start in their home with no threats. All they have to do is go through the mice hole to start their journey. In the first level, they must parkour to get to the exit at the top that both cats must reach. However, be careful, there will be threats that can damage the cat's health such as mousetraps, cat toys, and furniture. There will also be cat food along the way that can increase a cat's health, but only one cat can eat it. After making it to the top, they are teleported to the next area. Furniture will start falling down, both cats must avoid them and get to the other side where the mouse is. After catching the mouse, you have won the game.

Technology

Purrfect Pursuit was made using pygame, python, and gamelib.py. [Gamelib.py](#) allowed us to code animations and images like the background, platforms, threats, cats, and more. Using python, we were able to create game loops that separated each level. Before the game loops however, additional code was used to add the images and animations into the game. As well as some of the different game elements like the platforms for parkour in the first level and the controls for the cats in all levels. Since the cats are played separately, each cat got their own set of controls which contained the keys WASD for one cat and the arrow keys for the other.

In the second level, lists were used to have multiple furniture fall from the sky and showing how colliding with them will make you lose damage. Using elements from [Gamelib.py](#), we were able to show different screens as well. For example, if a cat dies, the game is over, therefore the game over screen will become visible. All spritesheets and images were found on the internet.
